

A Method and Workstation for Single Patient Medical Care

Abstract of the Disclosure

The present invention provides a reconfigurable medical workstation that can
5 enable efficient arrangement of medical equipment used to provide care to a specific
patient. The workstation contains a compartment space that can be divided into
compartments as needed to house the medical equipment. The compartment
configurations can be uniquely created to house the specific medical equipment for the
patient. Because the needs of patients are different and require different kinds of medical
10 equipment the compartment configuration for one patient can be different in the present
invention from the compartment configuration for another patient.
